DESCRIPTION

NEC's UPC3219GV is a Silicon Monolithic IC designed for use as an AGC Amplifier for digital CATV, cable modem and IP telephony systems. This IC consists of a two stage gain control amplifier and a fixed gain video amplifier. The device provides a differential input and differential output for noise performance, which eliminates shielding requirements.

The package is 8-pin SSOP (Shrink Small Outline Package) suitable for surface mount.

This IC is manufactured using NEC's 10 GHz ft NESATM II AL silicon bipolar process. This process uses silicon nitride passivation film. This material can protect chip surface from external pollution and prevent corrosion/migration. Thus, this IC has excellent performance, uniformity and reliability.

NEC's stringent quality assurance and test procedures ensure the highest reliability and performance.

PIN EXPLANATIONS

Pin No.	Name	Applied Voltage (v)	Pin Voltage (v) ¹	Description	Internal Equivalent Circuit
1	VCC	4.5 to 5.5		Power supply pin. This pin should be externally equipped with bypass capacitor to minimize ground impedance.	
2	INPUT1		1.45	Signal input pins of AGC amplifier.	
3	INPUT2		1.45		
4	VAGC	0 to VCC		Gain control pin. This pin's bias govern the AGC output level. Minimum Gain at V _{AGC} = 0.5 V Maximum Gain at V _{AGC} = 4.5 V Recommended to use by dividing AGC voltage with external resistor (ex. 100k)	
5	GND 2	0		Ground pin. This pin should be connected to system ground with minimum inductance. Ground pattern on the board should be formed as wide as possible.	
6	OUTPUT2		2.2	Signal output pins of video amplifier	
7	OUTPUT1		2.2		
8	GND 1	0		Ground pin. This pin should be connected to system ground with minimum inductance. Ground pattern on the board should be formed as wide as possible. All ground pins must be connected together with wide ground pattern to decrease impedance difference.	

Note:

1. P_{IN} is measured at V_{CC} = 5 V
